*Data collected is not over the entire month.

[†] The high temperature recorded is only for a 30 minute period. For ten days in a row in the month of August at 11:00AM or 11:30AM the temperature would increase from the mid-60° F to 90°-100° F then decrease a half an hour later back to the 60°-70° F. This may be caused from a break in the tree canopy allowing sun light to heat the pool for a short time.

[‡] Data collected was recorded during low flow and is most likely a measure of air temperature and exposure to the sun.
